

**Manitoba Hydro Undertaking #27**

**File with the board a listing of the gigawatt hours of load that has been lost since 1981. Provide data in such a way that there is no identification of specific customers.**

Of the individually forecast customers within the Top Consumers group, two major load losses have occurred since 1981; a major load loss is considered to be 60 GW.h or more that has not been made up within a few years by load increases by the same company.

- One customer with a load loss less than 100 GW.h occurred between 2003 and 2005. This company remains active in Manitoba and continues to operate at a reduced consumption level.
- One customer shut down operations in 2009 reducing energy consumption in the range of 500 GW.h.
