

MANITOBA HYDRO 2008/2009 POWER RESOURCE PLAN

The objectives of the 2008/09 Power Resource Plan are as follows:

- Provide a recommended development plan including the WPS and MP sales.
- Provide an alternative long-term development plan, which does not include the WPS and MP sales.

2008/09 Development plan including the WPS and MP sales

The recommended development plan for major infrastructure and resources to facilitate the WPS and MP sales is as follows:

- Near-term (pre 2015) deficits to be filled with contracted imports.
- Keeyask for a 2018 ISD (In-Service Date)
- Conawapa for a 2022 ISD.
- Bipole III as well as any additional north-south transmission beyond 2000 MW sufficient for new northern generation.

In addition to these resources, Manitoba Hydro has been authorized to enter into negotiations for the purchase of 300 MW of wind power.

This development plan reflects signed term sheets with Northern States Power (NSP) for 375/500 MW starting in 2015, Wisconsin Public Service (WPS) for 500 MW starting in 2018, and Minnesota Power (MP) for 250 MW starting in 2022. These Sales provide economic and other strategic benefits. In order to fulfill the terms of these proposed sales, the following are required:

- a new interconnection to Minnesota and Wisconsin by 2018,
- new hydraulic generation in Manitoba, and
- sufficient transmission from the new hydraulic generation to southern Manitoba.

The following summarizes major planned infrastructure and identifies additional planned supply initiatives:

Supply-Side Enhancement Projects (SSE)

Planned Additional: Total: 226 MW/ 273 GW.h by Mar 2018

Kelsey Rerunning 77 MW/ 0 GW.h by 2012/13

HVDC Bipole III Line (West) 89 MW/ 243 GW.h by 2017/18

Winnipeg River Plants 30 MW/ 30 GW.h

License Review and Continued Operation: Total: 357 MW/ 2517 GW.h

Selkirk #1-2 132 MW/ 1060 GW.h *

Brandon #5 Licence Review 105 MW/ 837 GW.h to 2018/19

Pointe du Bois (Rebuild) 120 MW/ 620 GW.h 2016/17 (total plant)

*Generation at Selkirk is assumed to be available on a continuous basis throughout the planning time frame due to expected infrequent operation.

Demand Side Management Program (DSM)

Planned additional (by Mar 2018)

180 MW/ 837 GW.h

New Generation

Hydro:

| | | | |
|-----------|---------------|-------------|---------|
| Wuskwatim | 200 MW gross | 200 MW net | 2011/12 |
| Keeyask | 695 MW gross | 630 MW net | 2018/19 |
| Conawapa | 1485 MW gross | 1300 MW net | 2022/23 |

Wind:

| | | |
|-----------|--------|---------|
| Wind Farm | 300 MW | 2010/11 |
|-----------|--------|---------|

Uncommitted projects in the plan are subject to corporate approval based on individual project evaluations prior to each stage in the development process. The definitive agreements being negotiated in good faith from the Sales Term Sheets are subject to Manitoba Hydro approval.

Tables A1.a at the end of this document details the annual energy supply and demand values of this plan. Table A1.b details the annual capacity supply and demand values of this plan.

2008/09 Alternative development plan without the WPS and MP sales

The alternative development plan for major infrastructure and resources to meet Manitoba requirements without the MP or WPS Sales is as follows:

- Near-term (pre 2015) deficits to be filled with contracted imports.
- 400 MW Combined Cycle Gas Turbine for 2019 ISD
- Conawapa for a 2021 ISD.
- Bipole III

In addition to these resources, Manitoba Hydro has been authorized to enter into negotiations for the purchase of 300 MW of wind power.

Further studies are required to fully develop this alternative plan.

Tables A.2a at the end of this document details the annual energy supply and demand values of this plan. Table A2.b details the annual capacity supply and demand values of this plan.

SUPPLY ASSUMPTIONS:

The supply assumptions in this section cover the resources that are evaluated in this plan. The major assumptions associated with each resource are described, focusing on those assumptions that have changed from the 2007/08 Power Resource Plan.

Conawapa:

Conawapa nominal rating (system incremental capacity) has changed from 1250 MW to 1300 MW to reflect the net system addition during peak Manitoba loading conditions (winter). This change is due to a variety of refinements in the plant design. The plant will be rated for 1485 MW during open water conditions. Initial impoundment of the forebay will reduce Limestone output by 90 MW, providing a net increase in summer capacity of 1395 MW. Downstream ice conditions will reduce Conawapa output by about 55 MW and similarly ice conditions will further reduce Limestone by 35 MW during winter peak conditions resulting in the 1300 MW nominal net addition rating.

The increased discharge of Conawapa is not anticipated to significantly change the estimate of energy produced from previous estimates. The increased discharge will make Conawapa better suited to shift energy from off-peak to on-peak periods. This has been reflected in this study.

In this study, the earliest in-service date assumed for Conawapa, if it is constructed in conjunction with Keeyask, is 2022. It is assumed that there must be at least four years between the in-service dates of these two plants. Otherwise Conawapa's earliest ISD is assumed to be 2021.

Keeyask:

Keeyask nominal rating has changed from 620 MW to 630 MW to reflect more efficient turbines. The plant will be rated for a maximum output of 695 MW, which has changed from previous values of 675 MW. This reflects the maximum generation potential when Stephens Lake is drawn down. Keeyask will not impact the capacity of any other plants and is not significantly affected by ice conditions. Therefore, the nominal capacity and net system addition are both 630 MW.

Keeyask earliest in-service date is assumed to be 2018 for this resource plan.

Wuskwatim:

The infrastructure portion of the Wuskwatim project is near completion and remains on schedule. The Wuskwatim General Civil Contract, signed on November 12, 2008, anticipates a September, 2011 ISD.

Kelsey:

The 2008/09 Power Resource Plan continues to include Kelsey rerunning which is projected to provide 77 MW of incremental capacity, increasing plant capability to 315 MW. There will be an increase the average annual energy but no increase in dependable energy.

To date two units have been rerunnered: Unit no. 5 was taken out of service in the fall of 2006 and was returned to service in August 2007, with an incremental gain in capacity of 10.7 MW. Unit 2 was taken out of service in January 2008 and returned to service in August 2008, with an incremental gain in capacity of 13 MW. The plan has all seven units rerunnered by March, 2012.

Pointe du Bois:

The 2008/09 Power Resource Plan includes the rebuilding of Pointe du Bois, at a rating of 120 MW and 621 GW.h of dependable energy with an in-service date of July 2016, one year later than assumed in the 2007 Power Resource Plan. This is an increase of 43 MW and 150 GW.h over the existing plant. The Rebuild alternative for Pointe du Bois includes the construction of a new powerhouse, new spillway, and the decommissioning of the existing structures. Manitoba Hydro is now formally commencing the regulatory process and is undertaking engineering design, environmental studies, and public consultation.

The Pointe du Bois project schedule is currently under review, however, it is anticipated that the Environmental Impact Statement (EIS) will not be submitted before 2009. Allowing for a five to six year construction schedule, this would mean that the earliest in-service date for an upgraded Pointe du Bois is expected to be July 2016. The resource plan has therefore included a “rebuilt” Pointe du Bois with a 2016/17 ISD.

Other Rerunning:

Evaluations are ongoing on Pine Falls, Great Falls and Slave Falls for supply-side improvements. It is expected that the Great Falls Unit 4 rerunning project will proceed and add about 10 MW in 2010. It is also expected that Pine Falls Units 1 and 2 will be rerunnered for a capacity increase of 10 MW in 2010 and 2011, and possibly Units 3 and 4 for a further 10 MW. The entire 30 MW of increased capacity is included in this report.

Existing Thermal Resources:

The License Review process for Brandon Unit 5 is ongoing but progress will remain at a standstill until the regulations are written implementing the provincial government's Climate Change and Emissions Reduction Act that proposes restricting Unit 5 operation to support of emergency operations. For this resource plan it is assumed that Unit 5 will continue to be available for drought and limited system support until March 2019, therefore, no changes to dependable energy ratings have been made for the 2008/09 Power Resource Plan.

No changes to Brandon Unit 6&7 operating characteristics have been made for the 2008/09 Power Resource Plan.

Manitoba Hydro received a revised Environment Act Licence for Selkirk G.S. in May of 2008. The Licence does not stipulate an expiry date. Due to the good physical condition of the units, the low anticipated levels of operation, and continuation of regular maintenance activities, Units 1&2 are expected to be serviceable well beyond 2019/20, which was the assumed license expiry date in the 2007/08 Power Resource Plan. For the purposes of this study, it has been assumed that Selkirk G.S. will remain operational until the end of the study period.

Potential New Thermal Resources:

In this year's Power Resource Plan, a 400 MW Combined Cycle Gas Turbine (CCGT) has been included as a resource option. In addition, a 43 MW Simple Cycle Gas Turbine (SCGT) has replaced the 120 MW SCGT option used in 2007/08. The 43 MW SCGT can be installed with short lead times in increments that more closely match growth in Manitoba load. The 43 MW unit has an estimated installed cost of \$57 million. For this reason, it is a more suitable SCGT option and complements the large CCGT option that has been included in this year's studies.

The 400 MW CCGT produces about 3100 GW.h of dependable energy, which is about the same dependable output of Keeyask. Its capital cost is estimated at \$471 million and because of its high efficiency it can produce energy at an operating cost of \$55/MWh with \$8/mmBtu gas. A \$30/tonne carbon cost adds less than \$10/MWh to the cost of operation.

Wind Generation:

Manitoba Hydro has been authorized to negotiate a Power Purchase Agreement for 300 MW of new wind power. As a result, 300 MW of wind has been included as a new resource in this year's plan with an ISD of 2010. Finalization of the Power Purchase Agreement is subject to Manitoba Hydro Electric Board approval.

Status of Bipole III (West):

Bipole III continues to be needed to meet reliability levels. To achieve an in-service date of 2017, Manitoba Hydro conducted an introductory round of community meetings with the elected officials and leadership of communities in the northern and southern parts of the Province from March to August 2008. These meetings provided opportunities to receive information about the need for Bipole III, the Bipole III concept, the Site Selection and Environmental Assessment (SSEA) process for selecting a route for the line, SSEA timelines and regulatory requirements, and to provide input into the Bipole III Project. Regional Public Open Houses were also held in September and October 2008 to share information about the project with interested parties.

Following Round One, the SSEA process commenced with the definition of a project study area which is large enough to identify several routes for Bipole III. Manitoba Hydro is currently holding Public Open Houses in Aboriginal communities potentially affected by the Bipole III Project. As well, Manitoba Hydro has initiated second round meetings with municipal officials within the project study area. Round two consultation activities will also include a series of Public Open Houses in the study area in agro Manitoba and in northern municipalities. Round two consultation activities are anticipated to be completed by the summer of 2009. A third round of consultation to present an evaluation and comparison of alternative routes for Bipole III will begin late this year and continue into 2010.

The 2017 ISD requires four years of SSEA studies, one year for project licensing and five winter construction seasons for both the line and converters. A final route will be determined through the application of Manitoba Hydro's SSEA process. A comprehensive community and public consultation program is critical to the success of the SSEA program, particularly a respectful and thorough process of Aboriginal community consultations.

For the western routed Bipole III HVDC line to be functional, the installation of both north and south converters stations are required. Bipole III is required for reliability, and therefore the costs of the converter stations have not been attributed to the new northern generating stations included in this analysis.

Additional North-South Transmission Requirements:

A 2000 MW Bipole III may not provide sufficient transmission to address potential reliability issues. Several options to increase the north-south transmission are being considered. These include increasing the size of Bipole III beyond 2000MW, upgrading the existing AC system, or building a new AC link. An allowance for additional transmission facilities has been included in this resource plan.

Demand Assumptions:

Demand Side Management:

The 2008/09 Power Resource Plan includes incremental DSM savings from the 2007 POWER SMART Plan.

The 2007 POWER SMART Plan outlines a detailed plan to achieve the Corporate target of electricity savings of 807 MW / 2759 GW.h by 2017/18. The Corporate target includes the savings to date of 465 MW / 1269 GW.h already achieved by March 31, 2007.

Base Load Forecast:

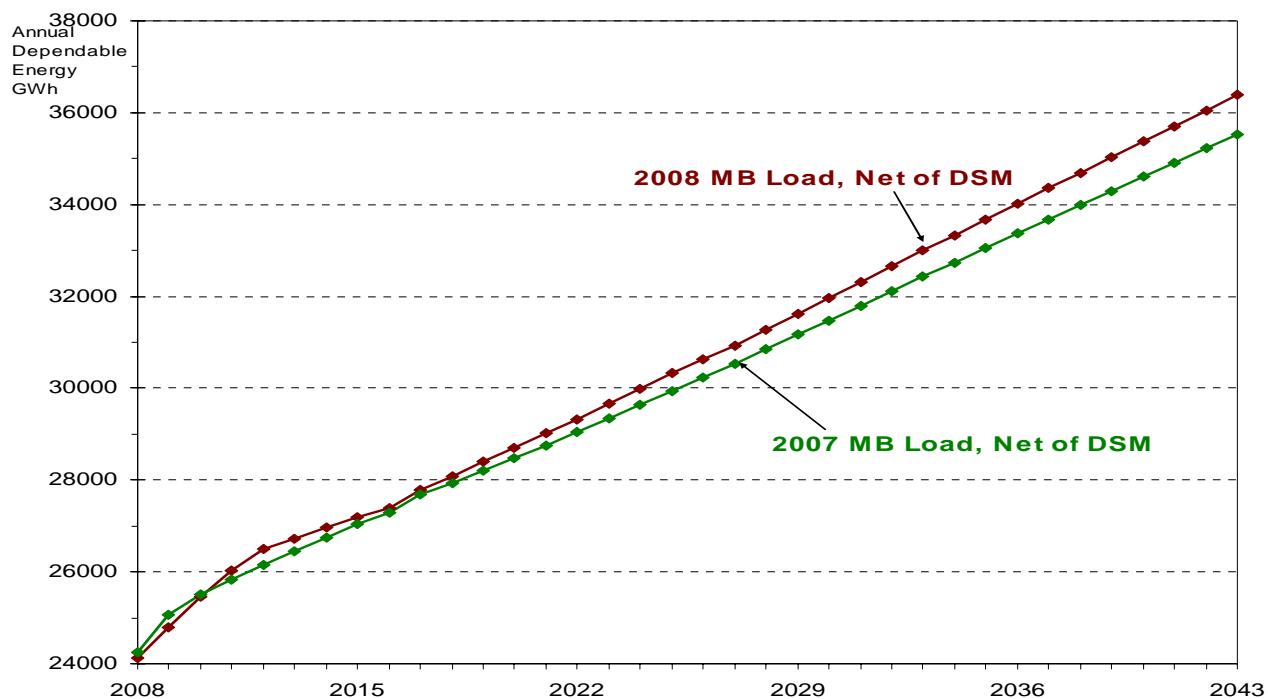

The 2008/09 load forecast is about 230 GW.h higher than in the 2007/08 Power Resource Plan by 2020 (net of DSM). For further details refer to the Electric Load Forecast 2008/09 to 2028/29 report.

The changes from the 2007/08 to the 2008/09 Base Load Forecast are primarily due to:

1. Increases in the Residential forecast as a result of a higher Manitoba population growth caused by higher immigration levels.
2. Increases in the Primary Metal sector load as a result of additional ore deposits discovery.
3. Decreases in the General Service forecast mainly due to an expected lower energy consumption in the Chemical and Potential Large Industrial Load classification.

Figure 1 below, compares the 2007 and 2008 Base Load Forecasts (net of DSM).

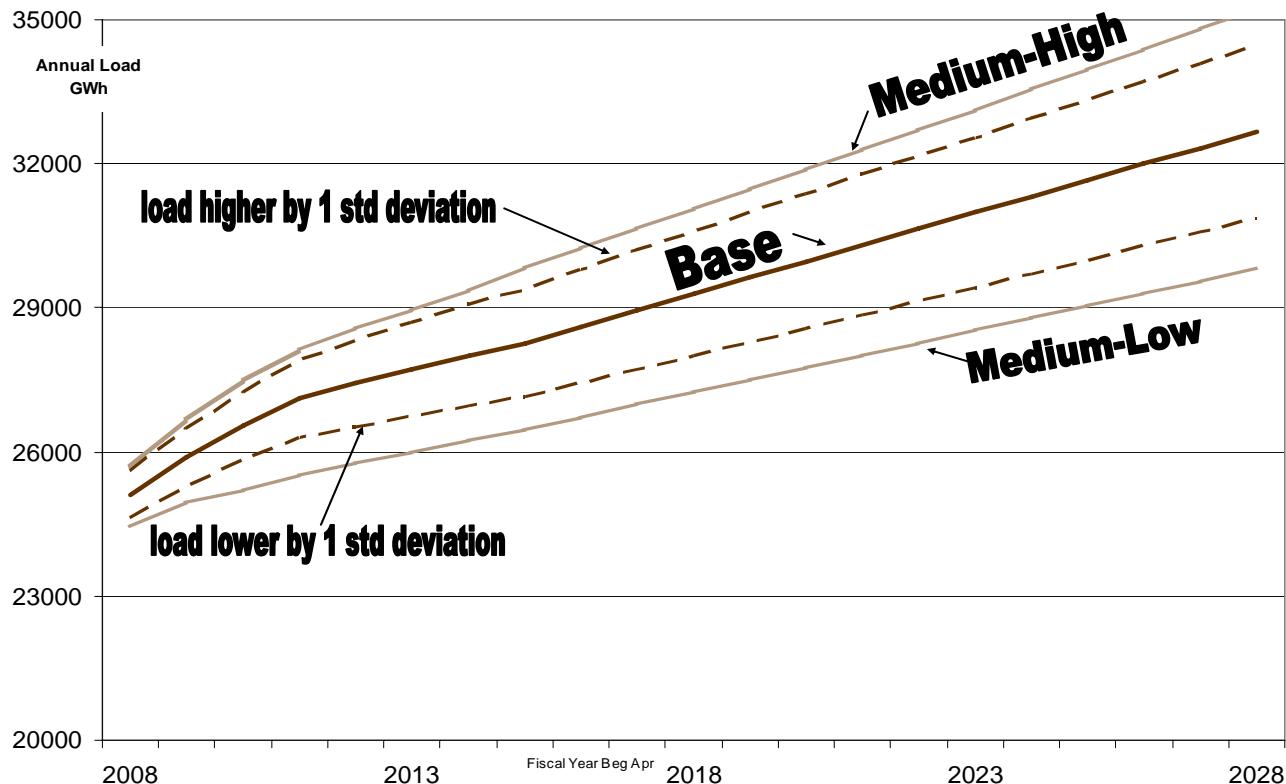

Figure 1
Comparison of 2007 and 2008 Load Forecasts (Net of DSM)

Impact of Higher and Lower Load Forecasts on Timing of New Resources

The 2008 Base, Medium-High, Medium-Low Electric Load Forecasts as well as the base load forecast plus and minus one standard deviation are compared below in Figure 2.

Figure 2
2008 Base, Medium High & Medium Low Load Forecasts
And +/- 1 Standard Deviation

Using the expected load forecast, the 2008/09 Integrated Financial Forecast Development Sequence shows a deficit of 224 GW.h in 2010 under dependable conditions. It is recommended that this deficit be met with contracted purchases. The plan includes 2700 GW.h/yr of energy guarantees associated with the NSP/UPA diversities, resulting in a total import of almost 3000 GW.h.

If the load approaches the Medium-High load forecast, then near-term dependable energy deficits increase to a maximum of about 1000 GW.h. Dependable energy deficits occur from 2010 through 2017, and again in 2020 to 2021 but are at a maximum in 2010. Winter peak capacity deficits also exist between 2018 and 2022.

Export and Import Assumptions

The 2008/09 Export Price Forecast was incorporated in the 2008/09 Power Resource Plan. Details of major export sales are described below.

Northern States Power (NSP) 375/500 MW Sale

The NSP 375/500 MW Sale is included for the first time in the 2008 Power Resource Plan. The contract is considered likely to proceed, as it replaces the existing contract with NSP, and requires no

new infrastructure. The sale is nearly neutral with respect to dependable energy, as a result of the terms included in it related to Manitoba Hydro experiencing adverse water conditions.

The term of the NSP sale is from May 1, 2015 through April 30, 2025. The Term Sheet, signed October 2006, includes a System Participation Sale for 375 MW ramping up to 500 MW in 2021. The sale also includes a 350 MW System Participation Diversity Sale for the seasonal exchange of energy.

Wisconsin Public Service (WPS) and Minnesota Power (MP) Sales

The term of the WPS sale is from June 1, 2018 through May 31, 2032. The Term Sheet, signed March 2008, is for a 500 MW System Participation Sale. The capacity of the sale ramps up from; 150 MW in 2018, to 300 MW in 2019, to 500 MW in 2020, ramps down to 250 MW in 2030, and terminates in 2032.

The firm portion of the MP sale is from May 1, 2022 through April 30 2035. Non-firm energy is to be sold, as it is available, beginning May 1, 2008. The Term Sheet, signed December 2007, is for a 250 MW System Participation Sale (throughout 2022 to 2035).

The WPS and MP Term Sheets require the development of definitive agreements for 500 MW and 250 MW of imports, respectively. Imports are available off-peak which is 8 hours every night of the week (7 x 8) plus all day Saturday and Sunday (2 x 16). For dependable energy calculations, imports were limited to the 7 x 8 hours.

These sales to Minnesota and Wisconsin will require a new interconnection to Minnesota/Wisconsin. These sales have no impact on near term deficits or the date that new generation would be needed to serve domestic load.

New Interconnection

The WPS and MP sales are contingent on having transmission interconnection with transfer capability of at least 750 MW north and south. Design of the line, including route location, voltage, and line capability has not yet begun. For planning purposes, new interconnection capability of 1000 MW for export and 750 MW for import was assumed with an ISD of 2018. An allowance of \$150 M 2008\$ was used to cover the capital, service and market costs of the portion of the new transmission line in Manitoba.

Near-Term Deficits

In this resource plan there is a dependable energy deficit in the 2010 of 224 GWh. This is less than the dependable energy deficits identified in the 2007/08 Power Resource Plan. There are 2700 GW.h of imports available under existing contracts included in the plan. An additional import requirement of 224 GWh would bring the total import to almost 3000 GW.h.

As imports have the lowest cost and risk of the available near-term options, it is recommended that firm contracts be secured, and there be no reliance on opportunity imports. It should be noted that the probability of drought conditions which will necessitate the imports beyond the existing diversity agreements is less than 3%.

Long-term Dependable Energy Deficits

Without new generation or new sales, the Manitoba load is expected to exceed dependable supply in 2019/20, one year earlier than last year's Power Resource Plan, at which time persistent and growing deficits in dependable energy would occur without new resources. Over the past several decades, capacity requirements in planning studies have occurred many years after dependable energy requirements due to a surplus of capacity in the system. In recent years the requirement for new capacity has continued to become closer to the timing of the energy need. Sufficient capacity now exists until 2022/23, only three years later than the requirement for dependable energy.

Previous studies have indicated that Conawapa is the most economic plant to meet dependable energy deficits in the longer term. However, Conawapa is not available until 2021 at the earliest. The advancement of Keeyask to 2018 in the recommended development plan eliminates dependable energy deficits after 2018. Similarly, the installation of a Combined Cycle Gas Turbine in 2019 in the alternative development plan eliminates these dependable energy deficits.

Financial Evaluation

The financial evaluation compares the year by year impacts of alternative generation sequences on Manitoba Hydro's projected financial statements and customer rates. Annual rate increases are consistent with those projected in the 20 Year Financial Forecast (Electricity Operations) approved by the Manitoba Hydro-Electric Board in January 2009. The financial evaluation was prepared comparing the recommended 2008/09 Integrated Financial Forecast Development Sequence or "Sale" sequence to the 2008/09 Alternative Development Sequence or "No-Sale" sequence. The evaluation shows that under expected export prices, the debt ratio is expected to increase by a maximum of 4.4% in the Sale case. Without any change in rate increases and assuming no change in any other financial conditions, the debt ratio will recover to the same level as in the No-Sale case by 2035/36. This increase is expected to cause the absolute level of the debt ratio to rise to less than 80% during the construction period and provides the potential for significant customer savings in the longer term as a result of profitable export sales.

Potential New Hydro Resources in Manitoba

Table 3 at the end of this document, summarizes the potential new hydro options in Manitoba. The table includes options considered in this resource plan as well as the most viable other sites on the Nelson, Churchill and Burntwood River systems.
