Undertaking 165: To determine what the total program cost would be given corrections, if any, determined to be appropriate in response to Undertaking 164:

## RESPONSE:

A corrected cost calculation for a fixed credit percentage of income-based program was provided in response to Undertaking 164. The request for "total program costs" in light of those changes is construed to ask for both the total program cost given the program as a whole, and the total program costs as it is spread over ratepayers through a cost recovery mechanism.

As Mr. Colton testified on cross-examination, the "total program cost" depends on policy choices made by the Commission. If a $6 \%$ "affordable burden" results in a "total program cost" that the Commission believes imposes an excessive burden on ratepayers through the proposed cost-recovery mechanism, the Commission may make alternative program design decisions to control the cost. For example, rather than implementing a program tied to an affordable burden of $6 \%$ of income, the Commission could approve a program tied to an $8 \%$ burden or to a $10 \%$ burden. Rather than offering the program to LICO-125 customers, the Commission could limit the program to LICO-100 customers.

Indeed, Mr. Colton's report in this proceeding states (page 45) that "Clearly, however, the reasonableness of an energy burden is a range and not a point. Ultimately, whether an affordable burden should be set as $6 \%$ or as $8 \%$ (or some other figure) is a policy decision." See, also, footnote 70, page 46.

Accordingly, determining the "total program cost" involves an assessment of the interaction between those costs and the policy decisions that are influenced by the level of those costs. The total program costs that are attached to this response thus present six scenarios, labeled as follows:
> Part 1 presents the home energy burdens and program design as contained in Mr. Colton's testimony (6\% heating burden; 3\% baseload burden);
> Part 2 presents home energy burdens set at $8 \%$ for heating and $4 \%$ for baseload;
> Part 3 presents home energy burdens set at $10 \%$ for heating and $5 \%$ for baseload.
> Part 1 (Alternative 1) presents the home energy burdens set at $6 \%$ for heating $/ 3 \%$ for baseload, but imposing a ceiling on benefits that will be provided in any given year;
> Part 2 (Alternative 1) presents the home energy burdens set at $8 \%$ and $4 \%$ (for heating and baseload respectively) with a ceiling imposed on benefits that will be provided in any given year;
> Part 3 (Alternative 1) presents the home energy burdens set at 10\% and 5\% (for heating and baseload) with a ceiling imposed on benefits that will be provided in any given year.

In each case, to the extent that the level of late fees was sufficient to do so, the administrative costs of the program were budgeted to be covered by residential late fee revenue.

The lesson to be learned from the requested calculation of "total program costs" is that program costs and the program policy design choices are inter-dependent on, and not independent of, each other.
